

### 1.What is Django-crispy-forms?

Django-crispy-forms can help with us fully control Django forms without writing custom form templates but still not break the standard way of using Django. All we need to do is use a `|crispy` filter and `{% crispy %}` tag in our code.

### 2.How does it change or enhance the standard forms capability available in Django?

It has powerful class called `Layout`, which allows us to set the order of the fields, wrap them in divs or other structures, add whatever we want, etc. We just need to attach the layout to a helper.

### 3.What further coding and/or configuration is required to use Django-crispy-forms?

Firstly, we need to install the package, then do the following:

for the `crispy` filter:

(1)Add `{% load crispy_forms_tags %}` to the template. (2)Append the `|crispy` filter to your form or formset context variable. (3)If you are using `uni_form` template pack, don't forget to add the class 'uniForm' to your form. (4)Refresh your page

for the `{% crispy %}` tag

We can just use the `{% crispy %}` tag.

### 4.Are you interested in using Django-crispy-forms in your Final Project? Why? Or, why not?

I am interested in using Django-crispy-forms in my Final Project. It sounds really cool and I would like to try something new.
