

- How much effort on average do you estimate it will take to refactor a view to use GCBVs?

I guess it would be really easy for me to refactor a view to use GCBVs. I though GCBVs really give us a much more easy way to create web app effectively.

- Based upon the estimate above, what do you estimate it will take to refactor all of your views?

I need to do create the original version of my code first and make sure it works well, then replace them by using GCBVs. Also, I think the most difficult part might be the PageLinksMixin class in the util.py file. I need to create my own version.

- Do you have any views in your Final Project that do not lend themselves to using GCBVs?

Why not?

No, I guess I would use GCBVs for all my views.

- How many lines of code do you estimate would be eliminated from your Final Project by refactoring to GCBVs?

I think it should be around 200 lines or more. GCBVs are really powerful, good to know that!
